Activity Course 5 TikTok project lab

February 17, 2025

1 TikTok Project

Course 5 - Regression Analysis: Simplify complex data relationships

```
[1]: import numpy as np
  import pandas as pd
  import platform
  import statsmodels
  print('Python version: ', platform.python_version())
  print('numpy version: ', np.__version__)
  print('pandas version: ', pd.__version__)
  print('statsmodels version: ', statsmodels.__version__)
```

Python version: 3.11.4 numpy version: 1.24.4 pandas version: 2.0.3 statsmodels version: 0.14.0

You are a data professional at TikTok. The data team is working towards building a machine learning model that can be used to determine whether a video contains a claim or whether it offers an opinion. With a successful prediction model, TikTok can reduce the backlog of user reports and prioritize them more efficiently.

The team is getting closer to completing the project, having completed an initial plan of action, initial Python coding work, EDA, and hypothesis testing.

The TikTok team has reviewed the results of the hypothesis testing. TikTok's Operations Lead, Maika Abadi, is interested in how different variables are associated with whether a user is verified. Earlier, the data team observed that if a user is verified, they are much more likely to post opinions. Now, the data team has decided to explore how to predict verified status to help them understand how video characteristics relate to verified users. Therefore, you have been asked to conduct a logistic regression using verified status as the outcome variable. The results may be used to inform the final model related to predicting whether a video is a claim vs an opinion.

A notebook was structured and prepared to help you in this project. Please complete the following questions.

2 Course 5 End-of-course project: Regression modeling

In this activity, you will build a logistic regression model in Python. As you have learned, logistic regression helps you estimate the probability of an outcome. For data science professionals, this is a useful skill because it allows you to consider more than one variable against the variable you're measuring against. This opens the door for much more thorough and flexible analysis to be completed.

The purpose of this project is to demostrate knowledge of EDA and regression models.

The goal is to build a logistic regression model and evaluate the model. *This activity has three parts:*

Part 1: EDA & Checking Model Assumptions * What are some purposes of EDA before constructing a logistic regression model?

Part 2: Model Building and Evaluation * What resources do you find yourself using as you complete this stage?

Part 3: Interpreting Model Results

- What key insights emerged from your model(s)?
- What business recommendations do you propose based on the models built?

Follow the instructions and answer the question below to complete the activity. Then, you will complete an executive summary using the questions listed on the PACE Strategy Document.

Be sure to complete this activity before moving on. The next course item will provide you with a completed exemplar to compare to your own work.

3 Build a regression model

4 PACE stages

Throughout these project notebooks, you'll see references to the problem-solving framework PACE. The following notebook components are labeled with the respective PACE stage: Plan, Analyze, Construct, and Execute.

4.1 PACE: Plan

Consider the questions in your PACE Strategy Document to reflect on the Plan stage.

4.1.1 Task 1. Imports and loading

Import the data and packages that you've learned are needed for building regression models.

```
[113]: import numpy as np
  import pandas as pd
  import platform
  import sklearn.metrics as metrics
  from sklearn.model_selection import train_test_split
  from sklearn.linear_model import LogisticRegression
```

```
from sklearn.preprocessing import OneHotEncoder
from sklearn.feature_extraction.text import CountVectorizer, TfidfVectorizer
from sklearn.utils import resample
from sklearn.metrics import classification_report
from sklearn.metrics import confusion_matrix, ConfusionMatrixDisplay
import matplotlib.pyplot as plt
import seaborn as sns
from scipy import stats
import statsmodels
```

Load the TikTok dataset.

Note: As shown in this cell, the dataset has been automatically loaded in for you. You do not need to download the .csv file, or provide more code, in order to access the dataset and proceed with this lab. Please continue with this activity by completing the following instructions.

```
[3]: # Load dataset into dataframe
data = pd.read_csv("tiktok_dataset.csv")
```

4.2 PACE: Analyze

Consider the questions in your PACE Strategy Document to reflect on the Analyze stage.

In this stage, consider the following question where applicable to complete your code response:

• What are some purposes of EDA before constructing a logistic regression model?

To understand the Data Structure, To identify missing Data, Detect Outliers, Check for Multicollinearity, Assess class imbalance, feature Target Relationships, Verify linearity of Logit

4.2.1 Task 2a. Explore data with EDA

Analyze the data and check for and handle missing values and duplicates.

2 someone shared with me that american industria...

Inspect the first five rows of the dataframe.

```
[4]: # Display first few rows
     data.head()
                          video_id video_duration_sec

percentile75 = data["video_comment_count"].quantile(0.75)

iqr = percentile75 - percentile25
upper_limit = percentile75 + 1.5 * iqr

data.loc[data["video_comment_count"] > upper_limit, "video_comment_count"] = upper_limit
```

Check class balance of the target variable. Remember, the goal is to predict whether the user of a given post is verified or unverified.

```
[135]: # Check class balance data["verified_status"].value_counts(normalize=True)
```

```
[135]: verified_status
   not verified     0.93712
   verified     0.06288
   Name: proportion, dtype: float64
```

Approximately 94.2% of the dataset represents videos posted by unverified accounts and 5.8% represents videos posted by verified accounts. So the outcome variable is not very balanced.

Use resampling to create class balance in the outcome variable, if needed.

```
[136]: # Use resampling to create class balance in the outcome variable, if needed

# Identify data points from majority and minority classes
data_majority = data[data["verified_status"] == "not verified"]
data_minority = data[data["verified_status"] == "verified"]

# Upsample the minority class (which is "verified")
data_minority_upsampled = resample(data_minority,
```

```
replace=True, # to sample with

n_samples=len(data_majority), # to match

majority class

random_state=0) # to create

**reproducible results

# Combine majority class with upsampled minority class
data_upsampled = pd.concat([data_majority, data_minority_upsampled]).

**reset_index(drop=True)

# Display new class counts
data_upsampled["verified_status"].value_counts()
```

```

Visualize a correlation heatmap of the data.

One of the model assumptions for logistic regression is no severe multicollinearity among the features. Take this into consideration as you examine the heatmap and choose which features to proceed with.

Question: What variables are shown to be correlated in the heatmap? Video_view_count and video_like_count are highly correlated 0.86

4.3 PACE: Construct

After analysis and deriving variables with close relationships, it is time to begin constructing the model. Consider the questions in your PACE Strategy Document to reflect on the Construct stage.

4.3.1 Task 3a. Select variables

Set your Y and X variables.

Select the outcome variable.

```
[143]: # Select outcome variable
y = data_upsampled["verified_status"]
```

Select the features.

[144]:	video_duration_sec	${\tt claim_status}$	author_ban_status	video_view_count	\

4	4110.0	547.0	152.0

4.3.2 Task 3b. Train-test split

Split the data into training and testing sets.

```
[145]: # Split the data into training and testing sets
X_train, X_test, y_train, y_test = train_test_split(X, y, test_size=0.25, □
→random_state=0)
```

Confirm that the dimensions of the training and testing sets are in alignment.

```
[146]: # Get shape of each training and testing set
X_train.shape, X_test.shape, y_train.shape, y_test.shape
```

```
[146]: ((26826, 7), (8942, 7), (26826,), (8942,))
```

4.3.3 Task 3c. Encode variables

Check the data types of the features.

```
[147]: # Check data types
X_train.dtypes
```

```
[147]: video_duration_sec
                                  int64
       claim_status

[149]: # Get unique values in `author_ban_status`
       X train["author ban status"].unique()
[149]: array(['active', 'under review', 'banned'], dtype=object)
      As shown above, the claim status and author ban status features are each of data type object
      currently. In order to work with the implementations of models through sklearn, these categorical
      features will need to be made numeric. One way to do this is through one-hot encoding.
      Encode categorical features in the training set using an appropriate method.
[150]: # Select the training features that needs to be encoded
       X_train_to_encode = X_train[["claim_status", "author_ban_status"]]

19

[158]: dtype('0')

```
[159]: # Get unique values of outcome variable y_train.unique()
```

[159]: array(['verified', 'not verified'], dtype=object)

A shown above, the outcome variable is of data type object currently. One-hot encoding can be used to make this variable numeric.

Encode categorical values of the outcome variable the training set using an appropriate method.

```
[160]: # Set up an encoder for one-hot encoding the categorical outcome variable y_encoder = OneHotEncoder(drop='first', sparse_output=False)
```

```
[161]: # Encode the training outcome variable
    # Notes:
    # - Adjusting the shape of `y_train` before passing into `.fit_transform()`,
    since it takes in 2D array
# - Using `.ravel()` to flatten the array returned by `.fit_transform()`, so
    that it can be used later to train the model
    y_train_final = y_encoder.fit_transform(y_train.values.reshape(-1, 1)).ravel()

# Display the encoded training outcome variable
    y_train_final
```

[161]: array([1., 1., 1., ..., 1., 1., 0.])

4.3.4 Task 3d. Model building

Construct a model and fit it to the training set.

4.4 PACE: Execute

Consider the questions in your PACE Strategy Document to reflect on the Execute stage.

4.4.1 Taks 4a. Results and evaluation

Evaluate your model.

Encode categorical features in the testing set using an appropriate method.

```
[164]: # Select the testing features that needs to be encoded
X_test_to_encode = X_test[["claim_status", "author_ban_status"]]
# Display first few rows
X_test_to_encode.head()
```

```

```

Encode the true labels of the testing set so it can be compared to the predictions.

```
[172]: # Encode the testing outcome variable
    # Notes:
    # - Adjusting the shape of `y_test` before passing into `.transform()`, sinceudit takes in 2D array
# - Using `.ravel()` to flatten the array returned by `.transform()`, so thatudit can be used later to compare with predictions
    y_test_final = y_encoder.transform(y_test.values.reshape(-1, 1)).ravel()
# Display the encoded testing outcome variable
    y_test_final
```

```
[172]: array([1., 1., 1., ..., 0., 1., 1.])
```

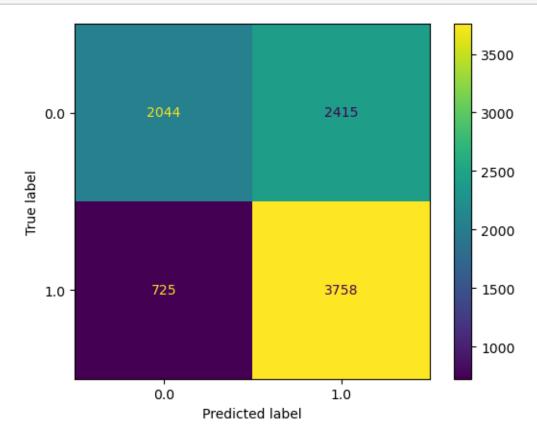

Confirm again that the dimensions of the training and testing sets are in alignment since additional features were added.

```
[173]: # Get shape of each training and testing set
X_train_final.shape, y_train_final.shape, X_test_final.shape, y_test_final.shape
```

[173]: ((26826, 8), (26826,), (8942, 8), (8942,))

4.4.2 Task 4b. Visualize model results

Create a confusion matrix to visualize the results of the logistic regression model.

Create a classification report that includes precision, recall, f1-score, and accuracy metrics to evaluate the performance of the logistic regression model.

```
[175]: # Create classification report for logistic regression model
    target_labels = ["verified", "not verified"]
    print(classification_report(y_test_final, y_pred, target_names=target_labels))
```

	precision	recall	f1-score	support
	-			
verified	0.74	0.46	0.57	4459
not verified	0.61	0.84	0.71	4483
accuracy			0.65	8942
macro avg	0.67	0.65	0.64	8942
weighted avg	0.67	0.65	0.64	8942

4.4.3 Task 4c. Interpret model coefficients

4.4.4 Task 4d. Conclusion

- 1. What are the key takeaways from this project?
- 2. What results can be presented from this project?

The data has some highly correlated variables so I dropped the column video_like_count from the model. It could have led to some multicollinearity issues when fitting the model. The model wasn't the best and could probably be better. 0.61 precision, but .84 recall isn't too bad.

The longer the video the higher the likelihood of the user being verified. The model had decent prediction..

I would move on to trying a Neural Network.

Congratulations! You've completed this lab. However, you may not notice a green check mark next to this item on Coursera's platform. Please continue your progress regardless of the check mark. Just click on the "save" icon at the top of this notebook to ensure your work has been logged.
